November 19, 2009

The Employee Trust Funds Board
801 West Badger Road
Madison, Wisconsin 53707

Ladies and Gentlemen:

The results of the *3-year investigation of experience* of the Wisconsin Retirement System are presented in this report. The investigation was made for the purpose of updating the actuarial assumptions used in valuing the actuarial liabilities of the Wisconsin Retirement System in compliance with Section 40.03(5)(b) of the Wisconsin Statutes.

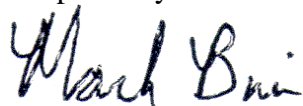

The investigation was based upon the statistical data furnished for annual active member and retired life actuarial valuations, supplemental information furnished by your Secretary and his staff, concerning Participants who died, withdrew, became disabled or retired during the last 3 years and on published historical economic data.

The investigation covered the 3-year period from **January 1, 2006 to December 31, 2008**, and was carried out using generally accepted actuarial principles and techniques.

To the best of our knowledge, this report is complete and accurate and was made in accordance with generally recognized actuarial methods. The actuaries submitting this statement are Members of the American Academy of Actuaries (MAAA), and meet the Qualification Standards of the American Academy of Actuaries to render the actuarial opinions contained herein.

We believe that the new actuarial assumptions that are the result of this investigation represent a reasonable estimate of past and possible future experience of the Wisconsin Retirement System.

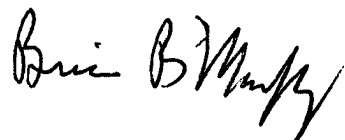

Respectfully submitted,

Mark Buis, FSA, EA, MAAA

Norman L. Jones, FSA, EA, MAAA

Brian B. Murphy, FSA, EA, MAAA

SUMMARY OF FINDINGS

INTRODUCTION

Each year, as of December 31, the liabilities of the Wisconsin Retirement System are valued. In order to perform the valuation, assumptions must be made regarding the future experience of the system with regard to the following risk areas:

- Rates of **withdrawal** of active Participants.
- Rates of **disability** among active Participants.
- Patterns of **salary increases** to active Participants.
- Rates of **retirement** among active Participants.
- Rates of **mortality** among active Participants, retirees, and beneficiaries.
- Long-term rates of **investment return** to be generated by the assets of the Fund.

Assumptions should be carefully chosen and continually monitored. A poor initial choice of assumptions or continued use of outdated assumptions can lead to:

- Understated costs resulting in either an inability to pay benefits when due, or sharp increases in required contributions at some point in the future;
- Overstated costs resulting in either benefit levels that are kept below the level that could be supported by the computed rate or an unnecessarily large burden on the current generation of Participants, employers and taxpayers.

A single set of assumptions will not be suitable indefinitely. Conditions change, and our understanding of conditions (whether or not they are changing) also changes.

In recognition of this, Wisconsin statutes require that assumptions used to value the liabilities of the Wisconsin Retirement System be studied in-depth every three years. The package of assumptions is then adjusted to reflect basic experience trends -- but not random year-to-year fluctuations. Actuarial assumptions were last revised following the December 31, 2008 regular actuarial valuation.

SUMMARY OF DECREMENT EXPERIENCE

Background: With the exception of mortality and disability, the decrements that we study tend to relate to voluntary human behavior. Human behavior in any short period can be influenced by economic and societal factors that change from time to time. Observed data will very often contain anomalies that cannot be assumed to continue into the future. This happens particularly in smaller groups.

In general, the present assumptions provide a reasonable match to the experience of the past three years and recommended adjustments to assumptions are relatively minor. In most cases, when adjustments are indicated, the proposed assumptions give partial recognition to present assumptions as well as to results from actual experience. Complete recognition is rarely given to actual experience over a limited period. This would cause contribution rates to be unduly sensitive to short-term experience fluctuations. More credibility was assigned to data that was similar to that found in the prior study, than was assigned to data that was materially different from the prior study.

In the past few experience studies, we have noticed that sometimes the use of new assumptions did not always reduce the size of the gain or loss in a particular decrement. Our experience with similar systems has shown that sometimes this is due to the relative magnitude of the liability of the members that decrement, rather than number counts alone. For example, consider a plan with only two members who are both the same age and assume member one has a liability of \$10,000 and member two has a liability of \$90,000. If one of the members leaves and forfeits all of the liability, the net rate of decrement is one out of two for a rate of 50%. However, the net gain or loss to the system will be 10% if member one leaves versus 90% if member two leaves.

As a result, we have added a column in some of our tables entitled 'liability weighted rate'. This represents the crude rate of decrement on a liability weighted basis as opposed to strictly a number count basis. The liability weighted rates were found to be more highly correlated with withdrawal and retirement decrements than population related rates. This makes some intuitive sense, since retirement and termination decisions are often made based on how much the members have to gain or lose if they retire or change jobs, whereas death and disability is typically not a decision at all, rather an event that happens to someone. Comments on specific assumptions are provided below. Tabular results are presented in summary form on page 5.

SUMMARY OF DECREMENT EXPERIENCE

Withdrawal Rates: In general, there were more withdrawals (terminations) than expected. However, this varied by, age, service and group. Additionally, the operation of the withdrawal decrement is impacted by the operation of a ‘forfeiture’ assumption. The current assumption is that 50% of members at age 35 will forfeit a withdrawal benefit (graded down to zero percent at retirement eligibility). We recommend that the forfeiture assumption be reduced to 25% and that the withdrawal (termination) rates be modified to move closer to the liability weighted rates (see discussion on Page 2). This change had a small upward effect on liabilities. Detailed information is presented beginning on page A-1.

Disability Rates: Overall, there were fewer disabilities than expected and we recommend lowering the incidence of disability for most groups. This change had a small downward effect on liabilities. Detailed information begins on page B-1.

Pay Increase Rate (Merit and Longevity Portion): The rates for General members were very close to the assumed rates and no changes are recommended at this time. Rates for Public School members were increased slightly to provide a closer match to actual experience. Experience for other groups varied and were adjusted closer to actual experience. Detailed information begins on page C-1.

Normal Retirement Experience: There were fewer normal retirements than expected in most groups. However, retirement experience was found to be more highly correlated with the liability weighted method described on page 2. As such, we modified the normal retirement rates slightly for all groups to move closer to the liability weighted rates. As more experience emerges, we will monitor these rates to see if further adjustments are necessary. This change has a minimal effect on liabilities. Detailed information begins on page D-1.

Early Retirement Experience: There were fewer early retirements than expected in most groups. However, retirement experience was found to be more highly correlated with the liability weighted method described on page 2. As such, we modified the early retirement rates slightly for all groups to move closer to the liability weighted rates. As more experience emerges, we will monitor these rates to see if further adjustments are necessary. Detailed information is included with the normal retirement experience beginning on page D-1.

SUMMARY OF DECREMENT EXPERIENCE

Mortality Among Retirees: Mortality rates among retired public employees have been declining for years. This leads to longer lifetimes after retirement and, therefore, to increased costs to the retirement system. A review of the data with respect to retirees (disabled and non-disabled) indicates that a reduction in male rates is called for at this time. Therefore, we recommend changing the multiplier for the male table from 100% to 90% and making no change to the female table. Mortality rates for disabled members were changed slightly to recognize actual experience. This change will have an upward effect on valuation liabilities for both the active and retired lives valuations. In addition, we are also recommending a change in the reserve for mortality improvements from 1.5% to 1.0% over a 3-year period. Detailed information begins on page E-1.

Mortality Among Active Members: Active member deaths were slightly below assumed rates for males and slightly above assumed rates for females. Therefore, we are recommending that the multiplier for the male pre-retirement mortality table be changed from 50% to 45% and making no change to the female table. Detailed information begins on page E-1.

Complete listings of all assumptions begin on page F-1.

SUMMARY OF DECREMENT EXPERIENCE

Decrement Risk Area	Actual	Expected	
		Current	Proposed
<u>Withdrawal - Total</u>

* Includes Early Retirements.

** Figures shown are for people below age 75.

ECONOMIC ASSUMPTIONS

Economic assumptions include **long-term rates of investment return** (net after expenses) and **wage inflation** (the across-the-board portion of salary increases). Unlike demographic activities, economic activities do not lend themselves to analysis solely on the basis of internal historical patterns because returns are more affected by external forces; namely inflation and general productivity changes which defy accurate long-term prediction. Estimates of economic activities are generally selected on the basis of the expectations in an inflation-free environment and then both are increased by some provision for long-term inflation.

If inflation and/or productivity increases are higher than expected, it will probably result in both actual rates of salary increases and investment return which exceed the assumed rates. Salaries increasing faster than expected produce unexpected liabilities. Investment return exceeding the assumed rates (whether due to manager performance, change in the mix of assets, or general market conditions) results in unanticipated assets. To the extent that inflation, productivity, and other factors have about the same effect on both sides of the balance sheet, these additional assets and liabilities can offset one another over the long-term.

Typically, no single investment period can be the sole basis for formulating economic assumptions. While information from the present experience period may be considered in developing new assumptions, long-term historical patterns must necessarily play a much larger role.

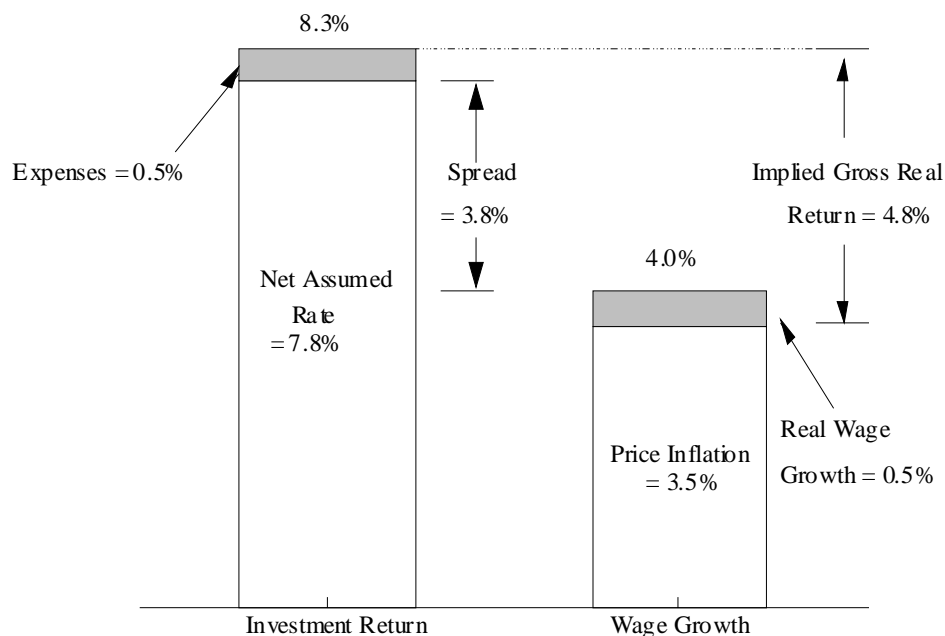

Wage inflation. The average rate of increase in National Average Earnings over the last 59 years is higher than the current WRS 4.1% assumption (see schedule on page 8). However, both regional and national average salaries have risen at a slower pace since. The difference between the long-term national averages and WRS experience is related to the excess rates of price and wage inflation during the 1970s which most observers do not expect to see repeated. When the decade of high inflation is factored out, long-term national averages approach a 4.0% wage inflation assumption, and recent experience is well below 4.0%. We believe it is reasonable to assume that the average rate in the future will be similar to the WRS experience rate in the past and that a rate in the range of 3.5% to 4.5% is reasonable. We recommend that consideration be given to lowering the wage inflation assumption from 4.1% to 4.0%.

ECONOMIC ASSUMPTIONS

Investment Return and Spread. The current WRS asset portfolio is a diversified mix of equity and fixed income investments. Real market returns (the spread between recognized net investment return and wage inflation) for balanced portfolios have averaged over 4.4% for the last 59 years (see schedule on page 9). The current real return assumption for the pension valuation is 3.7% (7.8% nominal less 4.1% wage inflation). Only hindsight will tell whether a particular combination of economic assumptions is optimal. If future economic patterns are as favorable as in the 1980's and 1990's, this spread would prove to be conservative. If, on the other hand, future investment markets produce lower real returns, contribution rate increases will become likely in the future.

The State of Wisconsin Investment Board advises that 7.8% is still a reasonable expected return rate for the WRS portfolio. We are recommending that the investment return remain at 7.8% and the resulting spread (due to a change in the wage inflation) be changed to 3.8%.

The relationship between economic assumptions based on a 3.8% spread is illustrated below:

No specific price inflation assumption is needed for this valuation. While this illustration is based on 3.5% inflation, the economic assumptions would also be consistent with other price inflation assumptions.

HISTORICAL PATTERNS OF INVESTMENT RETURN, PAY INCREASES & INFLATION

Calendar Year Period	Gross Market Returns			Stocks (S&P 500)	Price Inflation (CPI)	National Average Earnings	Sample Balanced Fund*	
	Bonds (Long)		Cash Equiv. (T Bills)				Total Return (I)	Spread: I - NAE - e

Observation Period	Spread
59 years	4.4%
49 years	3.5%
39 years	4.0%
29 years	5.9%

SUMMARY OF VALUATION RESULTS

The table below describes hypothetical valuation results at December 31, 2008 with new and old decrement assumptions with indicated wage inflation. The rate changes are illustrative only since contribution rates have already been set based upon the actual December 31, 2008 valuation results.

	General	Executive & Elected	Protective	
			With S.S.	Without S.S.
Present Average 2010 Contribution Rate	11.2%	11.9%	14.1%	15.5%
Hypothetical rate change due to:				
New decrements and 4.1% wage inflation (current)	0.4%	0.6%	0.6%	1.2%
New decrements and 4.0% wage inflation	0.2%	0.4%	0.2%	0.6%
New decrements and 3.9% wage inflation	0.0%	0.4%	0.0%	0.4%

New assumptions will be first used in the December 31, 2009 actuarial valuations, at which time experience gains or losses incurred during 2009 will also be recognized. This would first impact rates in 2011. Consequently, no rate changes are recommended for 2010.

OTHER RECOMMENDATIONS

Option Factors are calculated using a 5% interest assumption and the assumed rates of mortality with a blended mortality table consisting of 50% male rates and 50% female rates. If a retiring member elects an optional form of benefit, the straight life benefit is multiplied by the appropriate option factor to produce the benefit actually payable. Examples of option factors calculated using the present and proposed mortality assumptions are shown below. The factors shown illustrate that when mortality experience is improved (i.e., members live longer), that option factors generally increase. The revised factors will usually result in slightly higher benefits being paid when an optional form is elected. Option factors can be changed based upon this study since the mortality table has been changed. We recommend changing these factors October 1, 2010.

Age		5 Year C&L		15 Year C&L		Joint and 75%	
Retiree	Beneficiary	Current	Proposed	Current	Proposed	Current	Proposed
50	45	0.999	0.999	0.986	0.987	0.921	0.923
55	50	0.997	0.997	0.975	0.977	0.903	0.905
60	55	0.995	0.996	0.959	0.962	0.882	0.885
65	60	0.992	0.992	0.927	0.932	0.856	0.859
75	70	0.965	0.967	0.767	0.781	0.787	0.791

Recommended Implementation Schedule. It is recommended that the results of this experience study be implemented in accordance with the following schedule.

Active and Inactive Lives Valuation:	12/31/2009 Valuation
Retired Lives Valuation:	12/31/2009 Valuation
Option Factors:	10/01/2010

OTHER RECOMMENDATIONS

Participant Contribution Rate. By statute, rate changes are allocated among Participant Normal Cost, Employer Normal Cost, and a Benefit Adjustment Contribution. The Participant Normal Cost contributions are, in most cases, paid by the employers rather than by the participants. The original intent of the statutory allocation of the rate changes was most likely to permit participants to share in good and bad investments and other experiences. The actual result, however, seems to be that, for some members, good experience causes benefits to be decreased and bad experience causes benefits to be increased. This occurs because good experience decreases contribution rates which decreases future contribution balances, and conversely. Money purchase benefits, refund benefits and some death benefits are based on contribution balances. Consequently, we continue to recommend that policy makers revise statutes to change the participant contribution rate to a fixed percentage of payroll.

Reserve for ‘Other Losses’. Over the past several years, the gain/loss report has shown consistent losses that fall into the ‘other/unexplained’ category. This loss is likely due to either service purchases at retirement or additional compensation at retirement. In order to account for this, we established an adjustment of 1.0% to the calculation of final average earnings in the last experience study. We recommend increasing this adjustment to 2.0% for subsequent valuations. Furthermore, we recommended conducting a study to investigate the cause of these losses. This study is expected to be completed in the next several months. The effect of this change is reflected in our results on page 9.
